About UniStream® Remote I/O

This line of remote Ethernet I/O is compatible with UniStream controllers. The line comprises an Ethernet-based Remote I/O adapter and I/O Remote modules.

You configure Remote I/Os in UniLogic, using the Hardware Configuration editor, and connect them to the controller via Ethernet cable

A single UniStream Remote I/O adapter can support up to 63 12mm wide I/O modules. Each adapter comprises two Ethernet ports; this enables users to link an adapter to a controller, and then daisy-chain adapters to support up to 8 adapters per controller, increasing the total number of I/Os supported by a single UniStream.

UniStream Remote I/O offer a broad range of modules; each module offers a different configuration of analog and digital outputs.

Note that the exact number of I/Os that can be included per adapter is dependent on the specific I/O connected to that specific adapter.

The adapter is limited to process 192 data bytes for inputs and 192 data bytes for outputs.

Each digital input/output point process data is 1 bit (minimum 1 byte per module if module data size is less than 8 points) while each analog input/output is 2 bytes (8 inputs/outputs module will be 16 bytes of process data).

UniStream Remote I/O and Uni-I/O modules

You may use both lines in the same application at the same time.

Since the two lines communicate via different protocols and physical connections:

- They work independently of each other
- You can use both lines with the same controller at the same time.

Note that the adapters and modules of each line are **not** interchangeable.

You may only use:

- Uni-Local Expansion Adapters with Uni-I/O modules
- UniStream Remote I/O Adapters with UniStream Remote I/O modules.

IP Address Setup using BOOTP Server

The URB adapter IP defaults are:

Default IP: 192.168.100.100

Subnet mask: 255.255.255.0

Note that on the adapter, there is a sticker showing its MAC address.

Editing the IP defaults

There are two methods of changing the IP address:

- Via UniLogic's BOOTP Server
This is a utility accessible via the UniLogic ribbon
- Via DIP switch
These are physical switches on the adapter

Selecting the IP Configuration Method

To enable the selected method, you must raise the appropriate DIP switch on the adapter. By factory default, the adapter is supplied with all switches down.

- Raise #9 to set IP via BOOTP Server:
 - Enables the adapter BOOTP/DHCP.
 - After power up, the adapter will send up to 20 consecutive BOOTP/DHCP request messages, one for every 2 seconds.
 - In case that the BOOTP/DHCP server does not respond, the Adapter applies the latest saved IP address.
- Raise #10 to set IP via DIP switch:
You can then set the IP according to the description in the next table.

Configuring IP using Unitronics BOOTP Server

Before you can set the IP address of the Remote IO adaptor via Unitronics BOOTP Server, you must raise DIP #9 (check that #10 is down)

1. Power OFF the URB adapter.
2. Raise DIP switch #9 to enable DHCP / BOOTP.
3. In UniLogic, in the Solution Explorer, select the adapter; the ribbon will open the tab URB Remote I/O.
4. On the ribbon, click on Run BOOTP Server to open the utility.

5. Click Start BootP in the **Unitronics** BOOTP Server; the upper section displays Ethernet devices that are in the network.

6. Power ON the URB adapter.

IP Address Setup using BOOTP Server

The URB adapter IP defaults are:

Default IP: 192.168.100.100

Subnet mask: 255.255.255.0

Note that on the adapter, there is a sticker showing its MAC address.

Editing the IP defaults

There are two methods of changing the IP address:

- Via UniLogic’s BOOTP Server
This is a utility accessible via the UniLogic ribbon
- Via DIP switch
These are physical switches on the adapter

Selecting the IP Configuration Method

To enable the selected method, you must raise the appropriate DIP switch on the adapter. By factory default, the adapter is supplied with all switches down.

- Raise #9 to set IP via BOOTP Server:
 - Enables the adapter BOOTP/DHCP.
 - After power up, the adapter will send up to 20 consecutive BOOTP/DHCP request messages, one for every 2 seconds.
 - In case that the BOOTP/DHCP server does not respond, the Adapter applies the latest saved IP address.
- Raise #10 to set IP via DIP switch:
You can then set the IP according to the description in the next table.

URB Adapter DIP Switches

#	Role	Description
1	IP bit#0	Lowest IP Address octet when Switch #10=ON (raised) Example: XXX.XXX.XXX.IP [XXX.XXX.XXX represents the last configured network address] Example for full bitmap: XXX.XXX.XXX.100
2	IP bit#1	
3	IP bit#2	
4	IP bit#3	
5	IP bit#4	
6	IP bit#5	
7	IP bit#6	
8	IP bit#7	
9	DHCP / BOOTP	Enable DHCP / BOOTP
10	Use DIP IP Value	Enable IP Address set by DIP Switches

DIP # 9:
Enable IP via
BOOTP

DIP # 10:
Enable IP via
DIP switches

Configuring IP using Unitronics BOOTP Server

Before you can set the IP address of the Remote IO adaptor via Unitronics BOOTP Server, you must raise DIP #9 (check that #10 is down)

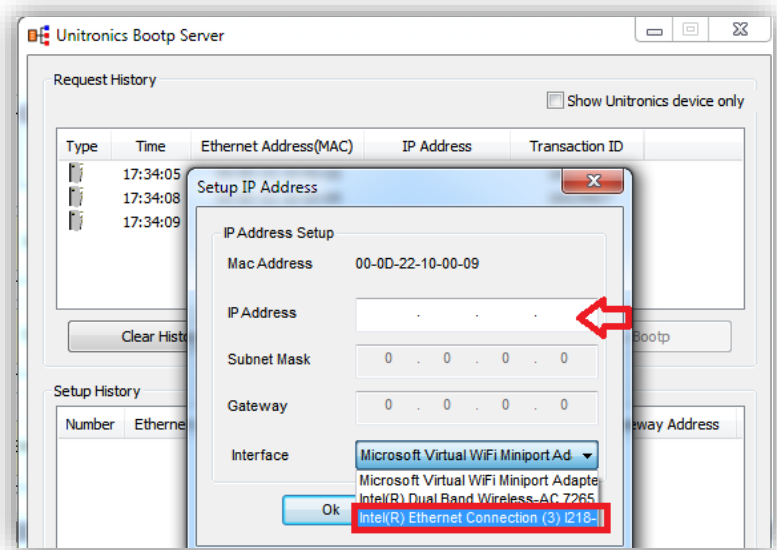

1. Power OFF the URB adapter.
2. Raise DIP switch #9 to enable DHCP / BOOTP.
3. In UniLogic, in the Solution Explorer, select the adapter; the ribbon will open the tab URB Remote I/O.
4. On the ribbon, click on Run BOOTP Server to open the utility.

5. Click Start BootP in the **Unitronics** BOOTP Server; the upper section displays Ethernet devices that are in the network.

6. Power ON the URB adapter.
7. Locate the adapter's MAC address and double-click on the row.
8. Enter the required IP address and select your PC Network card.

9. Click Ok. Now you should see the device in the bottom window including the IP address.

10. Power cycle the adapter; turn it off and on.

11. Use Ping from command line to check that the IP address is replying.

12. If the adapter replies successfully, then power off the adapter (URB-TCP) and lower DIP switch #9 (set to OFF).

13. Configure the adapter and IO modules in UniLogic and test.

3. Use Scenario

- URP-PS24V is system internal power expansion module.
- The URB-TCP network adapter system supplies a current of 1.5A. If your system current requirements exceed 1.5A, add a power supply such as the URP-PS24V.
- Position the power supply directly before the first module that will cause the requirement to exceed 1.5A, as shown in the example below.

3. Use Scenario

Field Power	
URB-TCP	10A max.
URB-TCP2	8A max.
URP-PDIST	10A max.

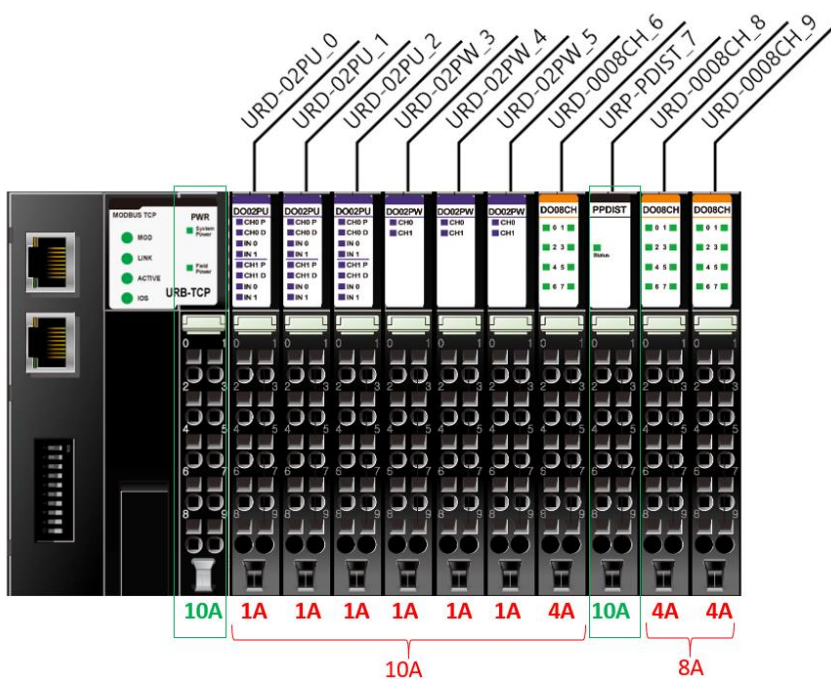

- Each URB series output unit can provide specified amount of current to connected end devices like: contactors, solenoids, sensors and etc.
- In case that the calculated required field power consumption exceeds the maximal provided current by the network adapter, URP-PDIST module must be added.

For example:

URD-0008CH can provide 0.5A per channel, total of 4A per module.

URD-04PW can provide 0.5A per channel, total of 2A per module.

So if the system have 2 X URD-0008CH and 1 X URD-04PW attached directly to the network adapter and all channels current usage it the maximal allowed, we need to add URP-PDIST is additional output modules attached.
